

Snagg Your Guitar(s)

Any musician who has lost an instrument to theft knows it can be one of life's more painful experiences. In recent years, though, science has intervened to make it easier to recover stolen instruments.

One such system being used by major manufacturers, including the Fender Custom Shop, has recently become available as an aftermarket item.

The Snagg system uses a microchip radio transmitter that, when scanned, sends back a 10-digit code that, when registered with a Snagg retailer, tells store owners and law enforcement officials who the rightful owner really is.

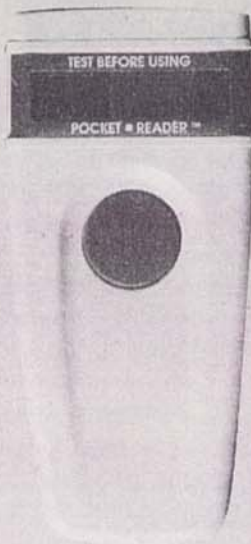

When an instrument's Snagg number is entered into the Snagg Internet Database, a record of ownership and a description of the instrument is recorded, down to the smallest scratch or modification.

The system involves implanting a microchip about the size of a grain of rice into the instrument, and it cannot be removed without significantly damaging the instrument; this makes attempted removal a non-issue. In some cases your instrument will come with the microchip already installed at the factory. In all other cases your dealer can arrange for implantation by an authorized technician upon your request. And the microchips can be installed in virtually any type of instrument, amplifier, or effects pedal.
